

Binomial Distribution, Part 1

According to Forbes (<https://www.forbes.com/sites/zackfriedman/2019/01/11/live-paycheck-to-paycheck-government-shutdown/#4693b2194f10>), 78% of American workers live paycheck-to-paycheck.

Let's say we take a random sample of 40 American workers.

- 1) What is the probability that fewer than 25 people in our sample are living paycheck-to-paycheck?
- 2) What is the probability that between 25 and 35 people (inclusive) in our sample are living paycheck-to-paycheck?
- 3) What is the probability that at least 35 people in our sample are living paycheck-to-paycheck?

Binomial Distribution, Part 2

Now, you will attempt to outdo Isaac Newton. See this video by Vsauce 2 for an entertaining description and analysis of the problem: <https://www.youtube.com/watch?v=RFITawWwLZc>. As described in the video, this is a problem which Isaac Newton got wrong. More precisely, he got the correct calculations, but his explanation was off. To be fair to Newton, the machinery of probability theory had not been developed yet in his time.

Use the binomial distribution to answer this question.

Which of the following three propositions has the greatest chance of success?

- A. Six fair dice are tossed independently and at least one "6" appears.
- B. Twelve fair dice are tossed independently and at least two "6"s appear.
- C. Eighteen fair dice are tossed independently and at least three "6"s appear.

Normal Distribution

The file [nhanes_pulse_sample.csv](#) contains a sample of 100 men between the ages of 30 and 40 from the 2015 National Health and Nutrition Examination Survey.

- 1) Plot the histogram and Q-Q plot for the pulse rate from this sample. Does it appear that pulse rates are normally distributed?
- 2) Use a normal approximation to answer the following questions:
 - a) Approximately what proportion of men between the age of 30 and 40 will have a pulse less than 60?
 - b) Approximately what proportion of men between the age of 30 and 40 will have a pulse greater than 100?

The file [appraisal_2017.csv](#) includes the appraised values for 1000 Davidson County homes in 2017.

- 1) Plot a histogram and Q-Q plot for the appraisal values. Does the distribution of the appraisal values appear to be approximately normal?
- 2) Apply a transformation to the appraisal values and then repeat the above step.
- 3) Use what you have found to approximate the proportion of total houses in Davidson County with appraisal value at least \$1,000,000.
